

empatika TRAINING

Our training courses are grounded in our experiences as researchers and emphasize participation, informality, and connecting with participants.

Developed by Empatika researchers and trainers, all of our courses draw on international participatory practices as well as our own learning and reflections. Empatika's training courses range from the foundations of qualitative research to more advanced and specialized research skills and approaches.

Participatory Practices for Better Engagement and Research

Introduces participants to key qualitative principles and techniques, combined with in-depth dives on effective communication, listening, facilitation techniques, and engaging visual exercises. The training builds practical and participatory skills, and helps participants develop creative approaches to enhance engagement with community members.

Available as an in-depth 3-day-training or a condensed 1-day version.

Designed for qualitative researchers, field officers, program designers and officers, students or fresh graduates.

Empathetic Research and Engagement Approaches

This series includes options on engaging children and adolescents in research, and conducting research in sensitive contexts, including principles, techniques, and ethics for working with children; and practical guidance for working in sensitive contexts or with vulnerable populations.

Methodology Training

This series includes our multi-day training on Immersion Research and Transformative Digital Storytelling. Both of these training courses are available offline or online.

The Immersion Research training combines workshop sessions with field practicum, exploring the principles, approaches, and tools to become experiential learners and build informal relationships with community members. In the Transformative Digital Storytelling training, participants create their own stories as part of building capability in using storytelling tools and techniques to add powerful personal elements to research, planning, and team building.

People-Centered Research for Development

This multi-day training aims to enable professionals to develop people-centered approaches to qualitative research design, data collection, and analysis as part of improving program relevance for beneficiaries. Designed for development and humanitarian organizations and professionals involved in program monitoring and research.

We also design customized training which can be fully tailored for your organization's unique needs. Please contact us to discuss.
